

## TEMPPO Designer V16.7 - Release Notes

- Multi-User functionality also when used in connection with TEMPPO Test Manager. Now it is possible to have more than one Designer project in a test structure. In this way the users can create libraries with reusable data and include them into their individual projects.
- Import of models from other sources
  - It is now possible to import information from UML models and other notations that can be saved as XMI (XML Metadata Interchange) files. In particular, this includes Activity Diagrams, State Machine Diagrams, and Interaction Overview Diagrams.
  - The model data is converted into task flows and can then be completed with test-specific information.
- When loading a project with libraries, minor errors such as objects missing from a library do not stop the load process. Instead, all tasks with invalid object references are highlighted with the new function “Show Load Errors”. For duplicate IDs, the user can choose which object version to keep.
- It is now possible to switch between horizontal and vertical display of the diagrams in the Task Flow and Test Case Editor.
