

Atos Breakout session
11 09 2019 – 10.30

Unified Service Delivery

Thomas Bierhoff

- ▶ The Unified Service Delivery is a brand-new Atos middleware technology for building and operating digital business processes across the entire enterprise IT service landscape. It supports the dynamic federation and collaboration of edge- and cloud hosted services inside enterprise networks and even beyond their boundaries. This new technology is fully owned by Atos and represents the Atos response for today's pressing problems of Industry 4.0 applications. The product development has already reached its first release milestone as a minimal viable product in Q2/2019. Beside several patent filling, the technology has also proven its value in several field trials jointly with business partners demonstrating its powerful performance and resilient operation in industry grade mobile and deployable applications.
