

AWS Breakout session
11 09 2019 – 16.15

Building Serverless Applications with Amazon Web Services.

Javier Ramirez,
AWS Technical Evangelist

Building Serverless Applications with Amazon Web Services.

- ▶ Serverless computing has gained popularity in the last few years, and some patterns to make the most of it have emerged. In this session, I will explain the basics of serverless applications using AWS Lambda, how to expose your functions using the Amazon API Gateway, and how to use AWS Step functions to coordinate complex workflows. Of course a demo will be included.

Javier Ramirez, AWS Technical Evangelist

I work as a Technical Evangelist at AWS to help developers make the best of cloud, so they can focus on solving interesting problems and rely on AWS for performance, scalability, elasticity, and security. I love data storage, big and small. I have extensive experience with different SQL, NoSQL, graph, in-memory, and Big Data solutions. I like distributed, scalable, always-on systems. Before working at AWS I spent 20 years developing software professionally and sharing what I learnt with the community. I've spoken at events in more than 15 countries, mentored dozens of start-ups, taught for 6 years at universities, and trained hundreds of professionals on cloud and data engineering. Having co-started 3 companies, I bring a startup mentality even when working with large corporations.
