

NetApp Breakout session  
11 09 2019 – 16.15

NetApp, a unique  
approach to the data pipeline

Jean-François Marie

# NetApp, a unique approach to the data pipeline

---

***Without the right data, in the right place, at the right time, the promise of data analysis would cease to exist. However, data is not a monolith. It is created in different places, is often moved and stored in multiple locations (edge, core, and cloud), and may be utilized in yet another location. Data also changes. Sometimes a little, sometimes a lot. Data comes in many forms. Structured and unstructured. Quantitative, or not. As videos, images, blocks, and files. To be successful, modern projects need a Data Fabric which provides a common framework for a seamless hybrid multicloud experience. We help you create a data fabric that allows you to discover, integrate, automate, and optimize, protect and secure your data, applications and resources.***

# NetApp, a unique approach to the data pipeline
